

Character Data

The characters and their metadata (like actions and consequences) are decoupled to allow mixing. But original links are maintained via the foreign key.

The character_obj table stores JSON objects as text (no native JSON in MySQL 5.5.55) and links them to the story they came from via the story_id column.

s_character
+ <u>c_id</u> : int(11) + fName: varchar(50) + lName: varchar(50) + gender: char(1) + c_desc: int(11) FK character_desc desc_id

character_desc
+ <u>desc_id</u> : int(11) + age: int(11) + temperment varchar(255)

character_obj
+ <u>c_id</u> : int(11) + charObj: text + story_id FK evaluated_story story_id

character_obj is now deprecated and evaluated_character used instead.
